Abstract:
For many marginalized community members e-inclusion intermediaries (e-IIs) are the only accessible and affordable option to access computers and the Internet, yet their use of the provided ICT is low. This is due to a lack of awareness about e-IIIs and ICT benefits. To create awareness and promote the use of ICTs by community members e-IIIs need more effective communication strategies that share information. Social media can be effective in this regard, yet many e-IIIs do not utilize their potential. This paper presents findings of a qualitative study that investigated how selected e-IIIs in South Africa communicate using social media. The study found that social media can facilitate communication for development by enabling low-cost, participatory communication approaches that build networks to share information, resources, and create awareness. Social media for e-IIIs is an efficient and cost-effective alternative for the South African community.
